Description

The TL072, TL072A, and TL072B are high speed JFET input dual operational amplifiers incorporating well-matched, high-voltage JFET and bipolar transistors in a monolithic integrated circuit.

The devices feature high slew rates, low input bias and offset current, and low offset voltage temperature coefficients.

	MM: machine model (7)	200		V
	CDM: charged device model (8)	1.5		kV

Notes:

(1)All voltage values, except the differential voltage, are with respect to the zero reference level (ground) of the supply voltages where the zero reference level is the midpoint between V_{CC}^{+} and V_{CC}^{-}.

(2)The magnitude of the input voltage must never exceed the magnitude of the supply voltage or 15 volts, whichever is less.

(3)Differential voltages are the non-inverting input terminal voltages with respect to the inverting input terminal.

(4)Short-circuits can cause excessive heating. Destructive dissipation can result from simultaneous short-circuits on all amplifiers.

(5)The output may be shorted to ground or to either supply. Temperature and/or supply voltages must be limited to ensure that the dissipation rating is not exceeded.

(6)Human body model: 100 pF discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of pin combinations with other pins floating.

(7)Machine model: a 200 pF cap is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 W). This is done for all couples of pin combinations with other pins floating.

(8)Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to the ground.
